A next step will be to test this hypothesis, for instance by performing studies of individual neurons in the *inferior colliculus* and cortex. This can’t be done in people, but can be done in animals.

So, not only have our experiments helped zero in on neurons involved in tinnitus and hyperacusis, they also indicate a next important step on the road to a cure.

Jennifer Melcher, Ph.D., is research co-director and auditory neuroscientist at the Massachusetts Eye and Ear Infirmary (MEEI) Tinnitus Center in Boston and assistant professor in the Department of Otology and Laryngology at Harvard Medical School.

Experiments performed by Jianwen Wendy Gu, M. Eng.
