Prescription Medications, Drugs, Herbs & Chemicals Associated with Tinnitus

American Tinnitus Association

This document is to be utilized as a conversation tool with your health care provider and is by no means a “complete” listing.

Anyone reading this list of ototoxic drugs is strongly advised NOT to discontinue taking any prescribed medication without first contacting the prescribing physician.

Just because a drug is listed does not mean that you will automatically get tinnitus, or exacerbate existing tinnitus, if you take it. A few will, but many will not. Whether or not you experience tinnitus after taking one of the listed drugs or herbals, or after being exposed to one of the listed chemicals, depends on many factors - such as your own body chemistry, your sensitivity to drugs, the dose you take, or the length of time you take the drug.

It is important to note that there may be drugs NOT listed here that could still cause tinnitus. Although this list is one of the most complete listings of drugs associated with tinnitus, no list of this kind can ever be totally complete – therefore use it as a guide and resource, but do not take it as the final word.

The drug brand name is italicized and is followed by the generic drug name in bold. Please note that not every brand name is included as some drugs have numerous brand names.

Each drug, herb, and chemical is referenced, with specific details found on page 27.

Thank you to Neil Bauman, Ph.D., for his work compiling this list for the American Tinnitus Association. To contact Dr. Bauman directly, email neil@hearinglosshelp.com.
